Testing performed by Julia Carleton, EE

The purpose of this test was to determine if there is any difference in performance between the Genasun GV10 and the Victron 75/15

A Solbian SP137 was used in full sun. Victron produced 7.8A, then the panel was quickly switched to the GV10 which produced 8.5A, then the Victron was quickly switched back to the panel. It then produced 7.7A. Then the panel was switched back to the GV10 again, which produced 8.1A.

Summary: **The GV10 outperformed the Victron 75/15**
